Application Note Temperature Sensor IC

1. TSic 206/203/201/306/316/303/301

The TSic series of temperature sensor ICs are specifically designed as a low-power solution for temperature measurement in building automation, medical/pharma technologies, industrial and mobile applications. The TSic provides a simple temperature measurement and achieves outstanding accuracy combined with long term stability.

The TSic has a high precision bandgap reference with a PTAT (proportional-to-absolute-temperature) output, a low-power and high-precision ADC and an on-chip DSP core with an EEPROM for the precisely calibrated output signal. The TSic temperature sensor is fully calibrated, meaning no further calibration effort is required by the customer.

Extended long wires (> 10 m) will not influence the accuracy. The TSic is available with digital (ZacWireTM, TSic x06), analog (0 V to 1V, TSic x01) or ratiometric (10 % to 90 % V $^+$, TSic x03) output signal. The low power consumption of about 35 μ A makes it suitable for many applications.

With an accuracy of ± 0.3 K in a temperature range of 80 K (e.g. ± 10 °C to ± 90 °C), the TSic sensors are more accurate than a class F0.3 (IEC60751) platinum sensor. The tolerances of the TSic and F 0.3 and F 0.15 platinum sensors are compared in Figure 1. With a standard calibration, the TSic 30x is more accurate than a F 0.3 platinum sensor in the range of ± 10 °C to ± 110 °C. The range can be shifted up or downwards to reach a high accuracy between e.g. ± 30 °C to ± 50 °C.

| Output ex- amples | | Temperature Ran | ge: -50 °C to +150 °C |
|----------------------|------------------------------|---------------------------------|--|
| Temp (°C) | Digital Values (TSic x06) | Analog 0 V to 1 V (TSic x01) | Analog Ratiometric 10 % to 90 % ($V^+ = 5.0 \text{ V}$) (TSic x03) |
| -50 ¹⁾ | 0x000 | 0.000 | 10 % V ⁺ (0.5 V) |
| -10 | 0x199 | 0.200 | 26 % V+ (1.3 V) |
| 0 | 0x200 | 0.250 | 30 % V ⁺ (1.5 V) |
| 25 | 0x2FF | 0.375 | 40 % V ⁺ (2.0 V) |
| 60 | 0x465 | 0.550 | 54 % V+ (2.7 V) |
| 125 | 0x6FE | 0.875 | 80 % V ⁺ (4.0 V) |
| 150 ²⁾ | 0x7FF | 1.000 | 90 % V+ (4.5 V) |

1) LT = -50 2) HT = 150 as standard value for the temperature calculation

Formulas for the output signal [°C]:

Analog output (0 V to 1 V):

 $T = Sig[V] \times (HT - LT) + LT[^{\circ}C]$

| | | V+ [V] | | |
|------------------------------------|----|--------|------------------|------|
| Ratiometric output (10 % to 90 %): | Τ= | 0.8 | x (HT - LT) + LT | [°C] |

Sig [V]

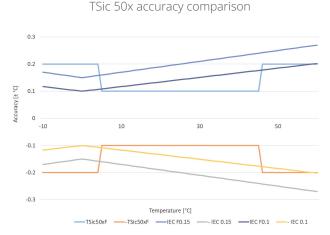

Digital signal Digital output - 11 bit:
$$T = \frac{Digital \ signal}{2047} \times (HT - LT) + LT [°C]$$

Digital output - 14 bit (TSic 316):
$$T = \frac{Digital \ signal}{16383} \times (HT - LT) + LT [°C]$$

2. TSic 506F/503F/516/501F

The TSic series of temperature sensor ICs are specifically designed as a low-power solution for temperature measurement in building automation, medical / pharma technologies, industrial and mobile applications. The TSic provides a simple temperature measurement and achieves outstanding accuracy combined with long term stability.

The TSic has a high precision bandgap reference with a PTAT (proportional-to-absolute-temperature) output, a low-power and high-precision ADC and an on-chip DSP core with an EEPROM for the precisely calibrated output signal.

The TSic temperature sensor is fully calibrated, meaning no further calibration effort is required by the customer. With an accuracy of ± 0.1 K in a range of 40 K (e.g. +5 °C to +45 °C), the sensor is more accurate than a class F0.1 (IEC 60751) platinum sensor. Extended long wires (> 10 m) will not influence the accuracy. The TSic is available with digital (ZacWireTM, TSic 506F), analog (0 V to 1 V, TSic 501F) or ratiometric (10 % to 90 % V⁺, TSic 503F) output signal. The low power consumption of about 35 μ A makes it suitable for many applications.

| Output Examples | Temperature Range: -10 °C to +60 °C | | | | | | |
|------------------------------|-------------------------------------|------------------------------|---|--|--|--|--|
| Temp (°C) | Digital Values (TSic x06) | Analog 0 V to 1 V (TSic x01) | Analog Ratiometric 10 % to 90 % (V^+ = 5.0 V) (TSic x03) | | | | |
| $< -10 \text{ to } -10^{1)}$ | 0x000 | 0.000 | 10 % V+ (0.5 V) | | | | |
| 0 | 0x124 | 0.143 | 21.4 % V+ (1.07 V) | | | | |
| 25 | 0x3FF | 0.500 | 50 % V+(2.5 V) | | | | |
| $+60^2$ to $> +60$ | 0x7FF | 1.000 | 90 % V+ (4.5 V) | | | | |
| 1) LT = -10 | | | | | | | |

2) HT = 60 as standard value for the temperature calculation

Formulas for the output signal [°C]:

Analog output (0 V to 1 V): $T = Sig [V] x (HT - LT) + LT [^{\circ}C]$

Digital output - 11 bit:
$$T = \frac{\text{Digital signal}}{2047} \times (\text{HT - LT}) + \text{LT [°C]}$$

Digital output - 14 bit (TSic 516):
$$T = \frac{\text{Digital signal}}{16383} \times (\text{HT - LT}) + \text{LT [°C]}$$

LT: Lower temperature limit [= -10 °C] V*: Supply voltage [V]

HT: Higher temperature limit [= +60 °C] Sig[V]: Analog/ratiometric output signal [V]

3. TSic 716

The TSic series of temperature sensor ICs are specifically designed as a low-power solution for temperature measurement in building automation, medical/pharma technologies, industrial and mobile applications. The TSic provides a simple temperature measurement and achieves outstanding accuracy combined with long term stability.

The TSic has a high precision bandgap reference with a PTAT (proportional-to-absolute-temperature) output, a low-power and high-precision ADC and an on-chip DSP core with an EEPROM for the precisely calibrated output signal. The IST AG TSic sensor is fully tested and calibrated to ensure the guaranteed accuracy.

| Output Examples | Temperature Range: -10 °C to +60 °C |
|-----------------|-------------------------------------|
| Temp (°C) | Digital |
| +35 | 0x2925 |
| +40 | 0x2DB7 |
| +45 | 0x3249 |

Formulas for the output signal [°C]:

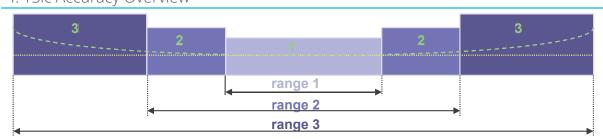

Digital output:
$$T = \frac{\text{Digital signal}}{16383} \times (\text{HT - LT}) + \text{LT [°C]}$$

LT: Lower temperature limit [= -10 °C] HT: Higher temperature limit [= +60

°C] V+:

4. TSic Accuracy Overview¹⁾

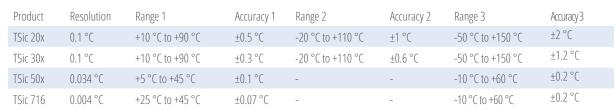

¹⁾ Range 1 can be shifted to a customer specific temperature

5. ZACwire™ Digital Output

5.1 TSic ZACwire™ Communication Protocol

ZACwire™ is a single wire bi-directional communication protocol. The bit encoding is similar to Manchester in that clocking information is embedded into the signal (falling edges of the signal happen at regular periods). This allows the protocol to be largely insensitive to baud rate differences between the two ICs communicating. In end-user applications, the TSic will be transmitting temperature information, and another IC in the system (most likely a µController) will be reading the temperature data over the ZACwire™.

5.2 Temperature Transmission Packet from a TSic

The TSic transmits 1-byte packets. These packets consist of a start bit, 8 data bits, and a parity bit. The nominal baud rate is 8 kHz (125 µsec bit window). The signal is normally high. When a transmission occurs, the start bit occurs first followed by the data bits (MSB first, LSB last). The packet ends with an even parity bit.

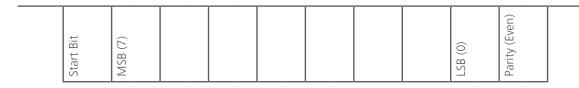

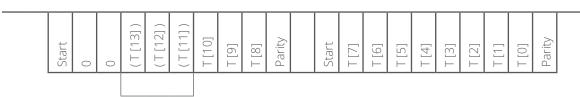

Figure 1.1 – ZACwire™ Transmission Packet

The TSic provides temperature data with 11-bit or 14-bit resolution, and obviously these 11 bits or 14-bit of information cannot be conveyed in a single packet. A complete temperature transmission from the TSic consists of two packets. The first packet contains the most significant 3 bits or 6 bits of temperature information, and the second packet contains the least significant 8 bits of temperature information. There is a single bit window of high signal (stop bit) between the end of the first transmission and the start of the second transmission.

For 14-bit res.

Figure 1.2 – Full ZACwire™ Temperature Transmission from TSic

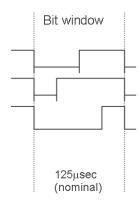

The bit format is duty cycle encoded:

Start bit => 50 % duty cycle used to set up strobe time

Logic 1 => 75 % duty cycle Logic 0 => 25 % duty cycle

Perhaps the best way to show the bit encoding is with an oscilloscope trace of a ZACwire™ transmission. The following shows a single packet of 96 Hex being transmitted. Because 96 Hex is already even parity, the parity bit is zero.

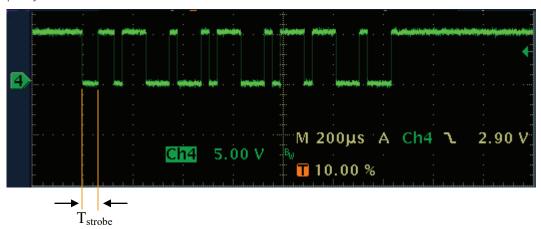

Figure 1.3 – ZACwire™ Transmission

5.4 How to Read a Packet

When the falling edge of the start bit occurs, measure the time until the rising edge of the start bit. This time (T_{strobe}) is the strobe time. When the next falling edge occurs, wait for a time period equal to T_{strobe} , and then sample the ZACwireTM signal. The data present on the signal at this time is the bit being transmitted. Because every bit starts with a falling edge, the sampling window is reset with every bit transmission. This means errors will not accrue for bits downstream from the start bit, as it would with a protocol such as RS232. It is recommended, however, that the sampling rate of the ZACwireTM signal when acquiring the start bit be at least 16x the nominal baud rate. Because the nominal baud rate is 8 kHz, a 128 kHz sampling rate is recommended when acquiring Tstrobe.

5.5 How to Read a Packet using a µController

It is best to connect the ZACwireTM signal to a pin of the μ Controller that is capable of causing an interrupt on a falling edge. When the falling edge of the start bit occurs, it causes the μ Controller to branch to its ISR. The ISR enters a counting loop incrementing a memory location (T_{strobe}) until it sees a rise on the ZACwireTM signal. When T_{strobe} has been acquired, the ISR can simply wait for the next 9 falling edges (8-data, 1-parity). After each falling edge, it waits for T_{strobe} to expire and then sample the next bit. The ZACwireTM line is driven by a strong CMOS push/pull driver. The parity bit is intended for use when the

The ZACwireTM line is driven by a strong CMOS push/pull driver. The parity bit is intended for use when the ZACwireTM is driving long (> 2 m) interconnects to the μ Controller in a noisy environment. For systems in which the "noise environment is more friendly", the user can choose to have the μ Controller ignore the parity bit. In the appendix of this document is sample code for reading a TSic ZACwireTM transmission using a PIC16F627 μ Controller.

5.6 How Often Does the TSic Transmit?

If the TSic is being read via an ISR, how often is it interrupting the μ Controller with data? The update rate of the TSic can be programmed to one of 4 different settings: 250 Hz, 10 Hz, 1 Hz, and 0.1 Hz. This is done during calibration of the sensor on IST AG side. The standard update rate is 10 Hz (TSic 206, TSic 306, TSic 506) or 1 Hz (TSic 716). For other update rates please contact IST AG. Servicing a temperature-read ISR requires about 2.7 ms. If the update rate of the TSic is programmed to 250 Hz, then the μ Controller spends about 66 % of its time reading the temperature transmissions. If, however, the update rate is programmed to something more reasonable like 1 Hz, then the μ Controller spends about 0.27 % of its time reading the temperature transmissions.

5.7 Solutions if Real Time System Cannot Tolerate the TSic Interrupting the μController

Some real time systems cannot tolerate the TSic interrupting the μ Controller. The μ Controller must initiate the temperature read. This can be accomplished by using another pin of the μ Controller to supply V_{DD} to the TSic. The TSic will transmit its first temperature reading approximately 65-85 ms $^{1)}$ (@RT) after power up. When the μ Controller wants to read the temperature, it first powers the TSic using one of its port pins. It will receive a temperature transmission approximately 65 ms to 85 ms later. If during that 85 ms, a higher priority interrupt occurs, the μ Controller can simply power down the TSic to ensure it will not cause an interrupt or be in the middle of a transmission when the high priority ISR finishes. This method of powering the TSic has the additional benefit of acting like a power down mode and reducing the quiescent current from a nominal 45 μ A to zero. The TSic is a mixed signal IC and provides best performance with a clean V_{DD} supply. Powering through a μ Controller pin does subject it to the digital noise present on the μ Controller's power supply. Therefore it is best to use a simple RC filter when powering the TSic with a μ Controller port pin. See the diagram below

1) This value is depending on the temperature. In lower temperatures this value can be lower too

μController powers TSic with a port pin through a simple RC filter.

5.8 Appendix A: An Example of PIC1 Assembly Code for Reading the ZACwire™

In the following code example, it is assumed that the ZACwire™ pin is connected to the interrupt pin (PORTB, 0) of the PIC and that the interrupt is configured for falling edge interruption.

This code should work for a PIC running between 2 MHz to 12 MHz.

6. Die and Package Specifications

6.1 SOP-8

The following dimensional drawings are for the TSic Series SOP-8 (SOIC Narrow, 0.150) package. See Table 1.1 and Table 1.2 on the next page for the dimensions labeled in these diagrams. Unless specified otherwise, dimensions are in inches.

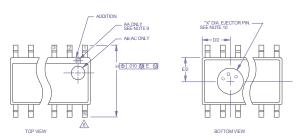

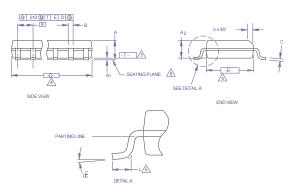

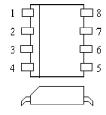

Notes:

- 1. Maximum thickness allowed is 0.015
- 2. Dimensioning and tolerances:

| Decimal | Angular | 3rd Angle Projection |
|----------------|---------|----------------------|
| .xx ±0.01" | ±1 °C | A - |
| .xxx ±0.002" | | \oplus |
| .xxxx ±0.0010" | | т - |

- 3. "T" is a reference datum
- 4. "D" & "E" are reference datums and do not include mold flash or protrusions but do include mold mismatch and are measured at the mold parting line. Mold flash and protrusions do not exceed 0.006 inches at the end and 0.01 " at the window
- 5. "L" is the length of the terminal for soldering to a substrate
- 6. "N" is the number of terminal positions
- 7. Terminal positions are shown for reference only
- 8. Formed leads are planar with respect to one another within 0.03 " at the seating plane
- 9. The appearance of the pin 1 marker is optionally either the round type or the rectangular type
- 10. Country of origin location on package bottom is optional and depends on assembly location
- 11. Controlling dimension: Inches
- 12. This part is compliant with JEDEC Standard MS-012, Variation AA, AB & AC

6.2.1 TO92 Pin Assignment

| Pin | Name | Description |
|-----|---|-------------------------------|
| 3 | $V^{\scriptscriptstyle +} \; (V_{\scriptscriptstyle DD})$ | Supply Voltage (3 V to 5.5 V) |
| 2 | Signal | Temperature Output Signal |
| 1 | Gnd (V _{ss}) | Ground |

6.3 Bare Die

6.3.1 Bare Die Pin Assignment

| Pin | Name | Description |
|-----------------------------|------------------------|-------------------------------|
| 3 | $V^+ (V_{DD})$ | Supply Voltage (3 V to 5.5 V) |
| 2 | Signal | Temperature Output Signal |
| 1 | Gnd (V _{ss}) | Ground |
| Die Thickness: Pad size: | | 390 μm 68 μm x 68 μm |

The analog and digital power and ground of the chip are wired to same substrate or Flex-Pad: V_{DDA} and V_{DD} are wired to $V_{DD'}$ and V_{SSA} and V_{SSA} are wired to Ground. The Signal pin needs only one wire.
